

Object recognition

1. Train classifier
 - Several different algorithms
 - Annotated images
 - Feature extraction etc.
2. Suggest proposal areas
 - Several different algorithms
3. Classify proposal areas
 - Several different algorithms

Example (first try)

- Transfer learning (Alexnet)
 - Deep convolutional neural network
 - Trained on millions of annotated images in thousands of categories
 - Retrain the last layers for specific classification task

1. Train classifier

- Class(es) of interest
- Not class(es) of interest

D. Suzukii

Background

D. Melanogaster

Image (DSC00180.jpg)

2. Proposal areas

Mask uninteresting areas

Here

Based on red background
of the trap

2. Proposal areas

Apply algorithm for
proposal areas

Here
Selective Search

2. Proposal areas

Select only interesting
boxes

Here
based on size and aspect
ratio

2. Proposal areas

Keep Select only interesting boxes

3. Classify boxes

Apply previously trained classifier per box

Here
Classifier trained on 4 species and background

3. Classify boxes

Clean predictions

Here
Based on overlap of
boxes and probability of
class

4. Compare classification to ground truth

Fly missed

Species mixed up

Suzukii classified as other species

Correctly classified as Suzukii (true positive)

Second try

1. get proposal areas

Red filter

Inverse

Select pixel clusters

Find cluster centers

Draw boxes

All Proposal Areas

Still some problematic areas:

- edges
- overlap
- shadow

(for later)

Precision = #correctly classified / #classified as Suzukii
 Recall = #correctly classified / #ground truth Suzukii

Number of classes: 2, TP: 17, FP: 3, FN: 7, Precision: 0.85, Recall: 0.71

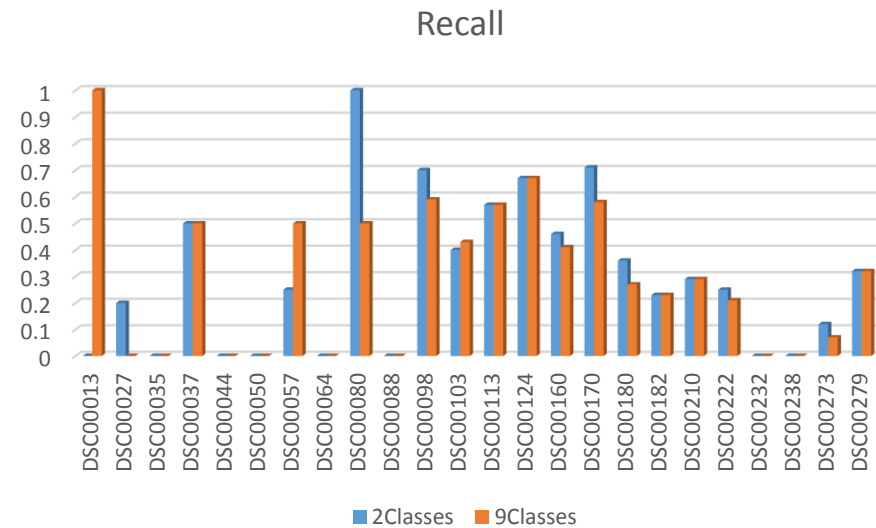

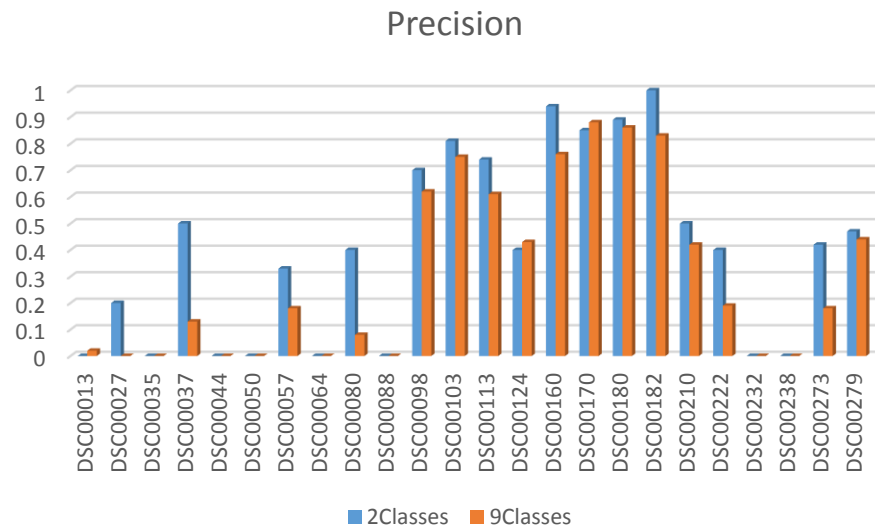

Number of classes: 9, TP: 14, FP: 2, FN: 10, Precision: 0.88, Recall: 0.58

Blue box = Ground truth (location of Suzukii); Blue box = False predicted Suzukii; Green circle (green and blue overlapping box) = correctly predicted Suzukii

What's better?

- Almost always just 2 classes

Sometimes it works, sometimes it doesn't

- Difficult lighting conditions
- Distance to trap
- Image at angle

Number of classes: 9, TP: 0, FP: 21, FN: 5, Precision: 0.00, Recall: 0.00

Number of classes: 2, TP: 0, FP: 0, FN: 5, Precision: NaN, Recall: 0.00

Photo requirements

- Resolution (Now: 5472 x 3648 px)
- Sensor target distance
- View angle
- Lightning conditions (shadows, sun glint)
- Sharpness
- Background (trap)
- ...

Data requirements

- Annotated images (Johannes, 2018)
 - Static images
 - Drone-based images
- Images by David
- Images by WUR
-

Planning

- Other cameras:
 - Mavic: 4000x3000 pix
 - DJI Zenmuse X4s: 5472x3648 pix
- Other than RGB: Hyperspectral / NIR / ...
- Publications
- DSS
- ...
